(54) Title: BICYCLIC THIOPHENE DERIVATIVES AND USE AS GONADOTROPIN RELEASING HORMONE ANTAGONISTS

(57) Abstract

A gonadotropin-releasing hormone antagonistic composition, which comprises an optionally substituted condensed-bicyclic compound consisting of a homo or hetero 5 to 7 membered ring and a homo or hetero 5 to 7 membered ring such as compounds of formulae (I) or (II) is effective as a propylactic or therapeutic agent for the prevention or treatment of several hormone dependent diseases, for example, a sex hormone dependent cancer (e.g. prostatic cancer, cancer of the uterine cervix, breast cancer, pituitary adenoma), benign prostatic hypertrophy, myoma of the uterus, endometriosis, precocious puberty, amenorrhea, premenstrual syndrome, polycystic ovary syndrome and acne vulgaris; is effective as a fertility controlling agent in both sexes (e.g. a pregnancy controlling agent and a menstrual cycle controlling agent); can be used as a contraceptive of male or female, as an ovulation-inducing agent of female; can be used as an infertility treating agent by using a rebound effect owing to a stoppage of administration thereof; is useful as modulating estrous cycles in animals in the field of animal husbandry, as an agent for improving the quality of edible meat or promoting the growth of animals; is useful as an agent of spawning promotion in fish.

Technical Field

The present invention relates to a pharmaceutical composition for antagonizing a gonadotropin-releasing hormone (GnRH) containing a condensed-bycyclic compound consisting of a homo or hetero 5 to 7-membered ring group and a homo or hetero 5 to 7-membered ring group. The present invention also relates to novel condensed-ring thiophene derivatives and salts thereof. The present invention further relates to methods for manufacturing the novel condensed-ring thiophene derivatives and the salts thereof.

Background Art

Secretion of anterior pituitary hormone undergoes 20 the control by peripheral hormone secreted from target organs for the respective hormones and by secretionaccelerating or -inhibiting hormone from hypothalamus, which is the upper central organ of anterior lobe of pituitary (in this specification, these hormones are 25 collectively called "hypothalamic hormone"). present stage, as hypothalamic hormones, nine kinds of hormones including, for example, thyrotropin releasing hormone (TRH) or gonadotropin releasing hormone {GnRH: sometimes called as LH-RH (luteinizing hormone 30 releasing hormone)} are confirmed their existence (cf. Seirigaku 2, compiled by M. Iriku and K Toyama, published by Bunkohdo, p610-618, 1986). These hypothalamic hormones are assumed to show their actions via the receptor which is considered to exist in the 35 anterior lobe of pituitary (cf. ibid), and observatinal studies of receptor genes specific to these hormones,

including cases of human, have been developed (Receptor Kiso To Rinshô, compiled by H. Imura, et al., published by Asakura Shoten, p297-304, 1993). Accordingly, antagonists or agonists specifically and selectively acting on these receptors control the action of hypothalamic hormone and controlling the secretion of anterior pituitary hormone. As the results, they are expected to be useful for prophylactic and therapeutic agents of anterior pituitary hormone dependent diseases.

10 Leuprorelin acetate [Fujino et al., Biological and Biophysical Research Communications, Vol.60, 00.406-413, 1974); Oliver, R.T.D. et al., British Journal of Cancers, Vol.59, p.823, 1989; and Toguchi et al., Journal of International Medical Research, Vol.18, 15 pp.35-41], which is a highly potent derivative of gonadotropic hormone-releasing hormone, one of the hypothalamic hormones, (hereinafter sometimes abbreviated as GnRH) [Schally A. V. et at., Journal of 20 Biological Chemistry, Vol. 246, pp.7230-7236, 1971; and Burgus, R. et al., Proceeding of Natural Academic Science, USA, Vol.69, pp278-282, 1972], by administration of multiple doses, lowers release.production of gonadotropic hormone in 25 pituitary, causing lowering of reactivity on gonadotropic hormone is spermary and ovary to suppress secretion of testosterone and estrogen. Leuprorelin acetate has, therefore, been known to show antitumor activity on such hormone-dependent cancers as 30 exemplified by prostate cancer, and has been widely used in the clinical field. Leuprorelin acetate has been widely used clinically also as a therapeutic agent of e.g. endometriosis and precocious puberty. The high antitumor activity of leuprorelin acetate is assumed to be due to its high resistance, as compared with 35 natural GnRH, against protease, and to high affinity to

GnRH receptor causing desensitization of GnRH due to decrease in number of receptors. However, as leuprorelin acetate is an ultra-agonist on GnRH receptor, it has been known that, immediately after the first administration, a transient aggravation accompanied with the rise of serum testosterone concentration due to pituitary-gonadotropic action (acute action) is observed. Circumstances being such as above, GnRH antagonistic drugs which are expected to have substantially the same therapeutic effects as described above but not to cause the above-mentioned transient pituitary-gonadotropic action (acute action) have been desired. As compounds having such GnRH antagonistic activity, a number of compounds including, for example, derivatives of GnRH such as straight-chain peptides, (USP 5140009, 5171835), cyclic hexapeptide derivatives [JPA S61(1986)-191698] or bicyclic peptide derivatives [Journal of medicinal chemistry, Vol.36, pp.3265-3273, 1993]. These compounds are, however, all peptides, which leave many problems including, for example, dosage forms, stability of drugs, durability of actions and stability on metabolism. For solving these problems, orally administrable GnRH antagonistic drugs, especially non-peptide ones, are strongly desired. At the present stage, however, no report on non-peptide GnRH antagonistic drugs has been made. The object of the invention lies in providing

The object of the invention lies in providing novel compounds having excellent gonadotropic hormone releasing hormone antagonistic activity as well as excellent gonadotropic hormone releasing hormone antagonistic agents.

Disclosure of Invention

Thus, the present invention provides a pharmaceutical composition for antagonizing a gonadotropin-releasing hormone (GnRH) containing a

condensed-bicyclic compound consisting of a homo or hetero 5 to 7 membered ring and a homo or hetero 5 to 7 membered ring. The present invention also provides, novel condensed-ring thiophene derivatives and salts thereof. The present invention further provides methods for manufacturing the novel condensed-ring thiophene derivatives and the salts thereof.

More specifically, the present inveniton provides:

In accordance with the method disclosed by K. 15 Gewald, E. Schinke and H. Bøttcher, Chem. Ber., 99, 94-100 (1966), an adequate ketone or aldehyde having an active methylene (i) was allowed to react with a cyanoacetic acid ester derivative and sulfur to convert into a 2-aminothiophene derivative (ii). More 20 specifically, in the case of using ketone (R' #H), it is subjected to heating under reflux together with a cyanoacetic acid ester derivative, in the presence of acetic acid and ammonium acetate, in a proper solvent such as toluene to give an alkylidene cyanoacetic acid ester derivative, which is then heated in an adequate 25 solvent, for example, ethanol in the presence of sulfur and a base to afford a 2-aminothiophene derivative (ii). And, in the case of using aldehyde (R'=H), it is heated in a proper solvent, for example, 30 dimethylformamide, in the presence of a cyanoacetic acid ester derivative, sulfur and a base to give a 2aminothiophene derivative (ii). The compound (ii) thus obtained is heated, in accordance with the method disclosed by Kuwata et al. [cf. German Patent 2,435,025], with diethyl ethoxymethylenemalonate to 35 give an adduct (iii). The adduct is stirred in a

solvent, which does not give undesirable effect on the reaction, (e.g. alcohols such as ethanol and methanol), in the presence of a base (e.g. alkali metal hydroxide such as potassium hydroxide and sodium hydroxide) at temperatures ranging from about 10 to 70°C to give 5 carboxylic acid (iv). Then, the carboxylic acid (iv) thus obtained was subjected to ring-closure by heating in polyphosphoric acid ester (PPE) to give a thieno[2,3-b]pyridine derivative (v). The compound (v)is stirred in a solvent, which does not give 10 undesirable effect on the reaction, (e.g. amides such as dimethylformamide and dimethylacetamide), in the presence of a halogenated aralkyl derivative and a base (e.g. an organic base such as pyridine and triethylamine) at temperatures ranging from about 10 to 15 100°C to give a 4,7-dihydro-4-oxothieno[2,3-b]pyridine-5-carboxylic acid ester derivative shown by the formula (Ia). Then, the compound (Ia) is stirred together with N-bromosuccinimide (NBS) in a solvent, which does not give undesirable effect on the reaction, (e.g. 20 halogenated hydrocarbons such as carbon tetrachloride and chloroform) in the presence of α , α' azobisisobutyronitrile, at temperatures ranging from about 30 to 100°C to give a compound (Ib). The compound (Ib) is stirred together with various amines 25 in a solvent, which does not give undesirable effect on the reaction, (e.g. amides such as dimethylformamide and dimethylacetamide, nitrile such as acetonitrile and alcohols such as ethanol) in the presence of a base at temperatures ranging from about 10 to 100°C to produce 30). The production method 1 described the compound (I above is shown in Scheme 1:

distilling off the solvent under reduced pressure. The residue was chromatographed on silica gel to give a yellowish solid (1.30 g, 52%), which was then

recrystallized from ethyl acetate - hexane to yellow crystals, m.p.277-280°C.

5-Benzylmethylaminomethyl-2,4(1H,3H)-dioxo-1-(2-fluorobenzyl)-6-nitrophenyl)thieno[2,3-d]pyrimidin-3-acetic acid ethyl ester hydrochloride

To a solution of the compound produced in Reference Example 25 (0.270 g, 0.47 mmol) in dimethylformamide (10 ml) were added, under ice-cooling, ethyl diisopropylamine (0.12 ml, 0.710 mmol) and benzylmethyl amine (0.07 ml, 0.56 mmol). The mixture was stirred for 20 hours at room temperature.

15

The reaction mixture was concentrated, and the concentrate was partitioned between ethyl acetate and a saturated aqueous solution of sodium hydrogencarbonate. The aqueous layer was extracted with ethyl acetate.

Organic layers were combined and dried (MgSO₄), then the solvent was distilled off under reduced pressure. The residue was chromatographed on silica gel to give a colorless oil (0.297 g, 100%). To a solution of this oil in ethyl acetate was added, under ice-cooling, 1N ethereal hydrochloric acid. The mixture was stirred for 10 minutes at the same temperature. The reaction mixture was concentrated under reduced pressure, and the concentrate was crystallized from ethyl acetate ether to give the corresponding hydrochloride (0.084 g)

3-Benzylaminomethyl-4,7-dihydro-7-(2-methoxybenzyl)-3-(4-methoxyphenyl)-4-oxothieno[2,3-b]pyridine-5-carboxylic acid ethyl ester hydrochloride

To a solution of the compound produced in Working Example 6 (0.245 g, 0.452 mmol) in dimethylformamide (5 ml) were added, under ice-cooling, triethylamine (0.10 ml, 0.717 mmol) and benzylamine (80 μ l, 0.732 mmol). The mixture was stirred for 90 minutes at room temperature. The reaction mixture was concentrated, and the concentrate was partitioned between ethyl acetate and a saturated aqueous solution of sodium hydrogen carbonate. The aqueous layer was extracted with ethyl acetate. The organic layer was dried (MgSO4), then the solvent was distilled off under reduced pressure. The residue was chromatographed on silica gel to give a colorless oil (0.135 g, 53%). a solution of the oily in ethanol (4 ml) was added, under ice-cooling, 1N ethanolic hydrochloric acid (0.2 ml). The mixture was stirred for 10 minutes with ice-The reaction mixture was concentrated under cooling. reduced pressure, which was crystallized from ethyl acetate and ether to give the corresponding hydrochloride (0.113 g) as white crystals, m.p.118-119°C.

Membrane fractions of rat pituitary and CHO cells expressing human GnRH receptors prepared in Test Examples 2 and 3 were respectively diluted with an 15 assay buffer to 200 $\mu g/ml$ and 188 μl each was distributed into tubes. In the case where the membrane fraction of rat pituitary anterior lobes were used, 2 μl of 0.1 mM of the compound dissolved in 60% DMSO 20 -(dimethyl sulfoxide) and 10 μl of 38 nM ¹²⁵I-leuprorelin were added simultaneously. In the case where the CHO cell membrane fraction expressing human GnRH receptors, 2 μl of 2mM of the compound dissolved in 60% DMSO and 10 μ l of 38 nM 125 I-leuprorelin were added simultaneously. For determining the amount of maximum 25 binding, a solution for reaction supplemented with 2 μl of 60% DMSO and 10 μl of 38 n M $^{125} I$ -leuprorelin was prepared. And, for determining the amount of nonspecific binding, a solution for reaction supplemented with 2 μl of 100 μM leuprorelin dissolved in 60% DMSO 30 and 10 μ l of 38nM 125 I-leuprorelin were also prepared simultaneously.

In the case where the membrane fraction of rat pituitary anterior lobes were used, reaction was allowed to proceed at 4°C for 90 minutes, while in the case where the CHO cell membrane faction expressing

10

15

human GnRH receptor was used, reaction was allowed to proceed at 25°C for 60 minutes. The reaction mixtures were respectively subjected to filtration under sucking with Whatman glass filter (GF-F) processed with polyethylenimine. After completing the filtration, radioactivity of the 125 I-leuprorelin remaining on the filter paper was measured with a γ -counter.

By calculation of (TB-SB)/(TB-NSB) x 100 (SB: radioactivity obtained when a compound was added, TB: maximum binding radioactivity, NSB: non-specific binding ratio activity, the binding inhibitory rate (%) of each test compound was determined. Besides, the inhibitory rates were determined by changing the concentrations of test compounds, and the concentration of a test compound inhibiting the (TB-NSB) by 50% (IC₅₀ value) was calculated by way of Hill plot. The results are shown in Table 32.

Inhibition of LH/FSH secretion by primary cultured cells of rat pituitary anterior lobes.

Anterior lobes of pituitary glands from 40 Wistar rats (8-week old, male) was put into a petri dish containing buffer A (0.7 mM sodium dihydrogen

phosphate, 137 mM sodium chloride, 5 mM potassium chloride, 25 mM HEPES, 50 µg/ml gentamicin sulfate), which was once washed with the buffer A, then the anterior lobes were divided into four portions, followed by further washing twice. A portion of thus-5 washed rat pituitary anterior lobes were put into a conical flask with a stopper containing enzyme solution I (buffer A containing 0.4% collagenase, 0.4% BSA (bovine serum albumin), 10 µg/ml deoxyribonuclease and 10 0.2% glucose. The mixture was incubated for one hour at 37°C with shaking. After sucking and discharging with a pipette repeatedly the tissue fragments were dispersed. The dispersion was transferred to a centrifugal tube, which was then centrifuged for 6 minutes to remove the supernatant. To the remainder 15 was added enzyme solution II (enzyme solution A containing 10% pancreatin), and the mixture was incubated for 8 minutes at 37°C, to which was added 2 ml of FCS (fetal calf serum). The mixture was again 20 centrifuged for 6 minutes at 480xg, and the supernatant was removed. The remainder was suspended in 10 ml of culture medium I (Dulbecco modified Eagle's medium containing 10% FCS, 20 mM HEPES, 50 U/ml penicillin G, 50 μ g/ml streptomycin, and 3.7 g/l sodium 25 hydrogencarbonate), which was subjected to filtration with nylon mesh. The material collected by the filtration was washed twice with 10 ml each portion of the culture medium I, followed by allowing the cells to be suspended in the culture medium I at a cell density of 5 x $10^5/\text{ml}$. One ml each of the cell suspension was 30 distributed to each well of a 24-well plate, which was incubated for 3 days in a CO2 incubator at 37°C under an atmosphere of 5% CO₂ - 95% air, to which was added 2 ml of the culture medium II (Culture medium I without 35 10% FCS), followed by incubation for one hour. The culture medium was removed. To each well of the 24well plate was added 800 μ l of fresh culture medium II, followed by addition of 20 μ M solution (100 μ l) of the compound 15 produced in Working Example 9 dissolved in 0.2% (v/v) dimethyl sulfoxide and 100 μ l of 5 nM GnRH simultaneously. The culture in the absence of the compound was employed as the control. After incubation at 37°C for 3 hours, 500 μ l of the culture supernatant was recovered, which was subjected to centrifuge for 10 minutes at 1000xg to collect the supernatant. The concentrations of LH and FSH in the supernatant were determined by using the radio immunoassay kit (Amersham Inc.).

By calculating in accordance with the formula; $100\text{-}(\text{LH or FSH concentration in the presence of the compound})/(\text{LH or FSH concentration of the control culture}) x 100, the inhibiting rate (%) of LH or FSH secretion by each compound was determined. The compound 15 inhibited the LH secretion by 28 <math>\pm$ 9.0% (p < 0.01, n=3), and inhibited the FSH secretion by 20 \pm 10% (p < 0.01, n=3).

From the foregoing results, the compound 15 produced in Working Example 9 was shown to have a GnRH antagonistic activity.

The compound produced in Working Example 56 was dissolved in vehicle II (0.5% methylcellulose dissolved in distilled water). The solution was administered oraly once a day during successive 3 days to male ICR mice (10-week old, n=12). The dosage was 30 mg per 1 kg of body weight. ICR mice administered with vehicle alone were used as control (n=15). At 24 hours after the administration, blood was collected from jugular vein under anesthesia with ether. To the blood were immediately added ethylenediamine tetracetate (EDTA) at a final concentration of 3 mg/ml and aprotinin at a final concentration of 300 KIU/ml. Box I	Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)				
This international search report has not been established in respect of certain claims under Article 17(2)(2) for the following reasons:					
1.	Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely: Although claims 35-42 are directed to a method of treatment of (diagnostic				
	method practised on) the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.	,			
2.	Claims Nos.: 23-26, 28-50 (searched incompletely) because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically: As the drafting of the claims is not clear and concise (Art. 6, PCT) and encom-				
	conomic grounds (See Art. 17(2)(a)(II), PCT). Guided by the spirit of the application and the inventive concept as disclosed in the descriptive part of the preent application the search has been based on the examples.				
	because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).				
Box II	Observations where unity of invention is lacking (Continuation of item 2 of first sheet)				
This Int	ernational Searching Authority found multiple inventions in this international application, as follows:				
	·				
1.	As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.				
2.	As all searchable claims could be searches without effort justifying an additional fee, this Authority did not invite payment of any additional fee.				
3.	As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:				
		!			
4.	No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:				
		;			
Remark	The additional search fees were accompanied by the applicant's protest.				
	No protest accompanied the payment of additional search fees.
